

Biologic Reasons for an Abortion-Breast Cancer Link

In the first of pregnancy, the breasts grow under the influence of pregnancy hormones, estrogen and progesterone.

With the stimulation of the pregnancy hormones, estrogen and progesterone, the number of breast cells are immature and cancer-vulnerable are markedly increased in number.

In short, if the mother has an abortion, a premature birth before 32 weeks gestation or a 2nd trimester miscarriage, she is left with more places (cells) for cancers to start.
